Global shrimp farming more than tripled production over the last decade. The major driver of that expansion was the introduction, adoption and expansion of farming *P. vannamei* as the shrimp species of choice. A key element determining farmers' preference for *P. vannamei* was widespread availability of High Health post-larvae (PL) produced from specific pathogen free (SPF) broodstock that outperformed other shrimp species in reliability and profitability. Production of High Health PL requires use of SPF broodstock in hatcheries using biosecurity. This chapter reviews key management practices of securing SPF broodstock and biosecurity in *P. vannamei* shrimp hatchery systems.
